Overview. The most basic type of integral equation is called a Fredholm equation of the first type, $\phi(x) = f(x) + \lambda \int_a^b K(x,y)\phi(y)dy$. The notation follows Arfken. Here ϕ is an unknown function, f is a known function, and K is another known function of two variables, often called the kernel function. Note that the limits of integration are constant: this is what characterizes a Fredholm equation.

Legendre polynomials are also useful in expanding functions of the form $\phi(\cos\theta)$ (this is the same as before, written a little differently): $\phi(\cos\theta) = \sum_{l=0}^{\infty} a_l P_l(\cos\theta)$, which arise naturally in multipole expansions. The left-hand side of the equation is the generating function for the Legendre polynomials. As an example, the electric potential $\hat{V}(r, \theta)$ (in spherical coordinates) due to a point charge located ...
